The two modern apartment buildings fit strikingly into the existing open development. Their elegant, crystal-like structure is evident in the floor plan. The cleverly chosen geometry pays attention to the sun's rays, external spatial qualities, as well as to the existing topography. A common underground garage is directly mapped to the two development zones. All apartments are linked by a lift system.

The building is divided with simple bands that emphasise the individual floors, and gives the houses an ordered and harmonious image.

The façades have large window fronts, combined with closed window panels. This combination allows at the same time generous living and lots of space for the private area inside. The subtle architecture lends the whole complex a stylish scale and a unique aesthetic.

Both the large mirroring of the window panes and also the user-friendly venetian blinds give the new residents a lot of control over the own privacy. The venetian blinds are electrically operated.

High openness and absolute closure are possible with this delicate architecture. Here, you can design your life according to your own variable needs.
